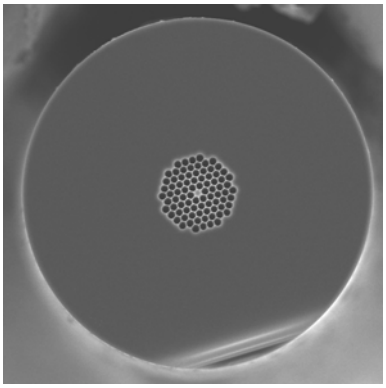
Highly nonlinear PCF



Our highly nonlinear photonic crystal fibers guide light in a small solid silica core, surrounded by a microstructured cladding formed by a periodic arrangement of air holes in silica. The optical properties of the core closely resemble those of a rod of glass suspended in air, resulting in strong confinement of the light and, correspondingly, a large nonlinear coefficient. By selecting the appropriate core diameter, the zero-dispersion wavelength can be chosen over a wide range in the visible and near infrared spectrum, making these fibers particularly suited to supercontinuum generation with Ti:Sapphire or diode-pumped Nd^{3+}-laser sources.

Nonlinearity: 54 W^{-1} km^{-1}
Zero dispersion λ=830nm
Single material
Spliceable

Unique properties of Highly nonlinear PCF

- Zero dispersion wavelengths from 670-880 nm available

- Near-Gaussian mode profile

Applications

- Supercontinuum generation for frequency metrology, spectroscopy or optical coherence tomography
- Four-wave mixing and self-phase modulation for switching, pulse-forming and wavelength conversion applications
- Raman amplification

Notes

1 Full 1/e-width of the near field intensity distribution

2 Sine of half angle at which a Gaussian fit to the far field intensity distribution has dropped to 1% of its peak value

3 $$A_{eff} = \frac{\left(\int_{\infty} |\mathbf{E}(\mathbf{r})|^2 d^2\mathbf{r} \right)^2}{\int_{silica} |\mathbf{E}(\mathbf{r})|^4 d^2\mathbf{r}}$$

4 $$\gamma = \frac{2\pi n_2}{A_{eff}\lambda}$$
